Hz university of Applied Science

Łukasz Krysmalski

Łukasz Krysmalski (Arison7)

About Me

I am 22 years old computer science student. I love problem solving and programming as a way to express myself. I'm more of an "old-school" programmer who sees AI as a tool, not a dependency.

Skills

- C++
- Python
- Javascript/Typescript
- Rust
- Php
- Linux
- Git
- REST APIs
- Django
- Django Rest Framework
- React
- Expo go
- Algorithms
- Data Structures
- SQL

Language

- English (C2)
- Polish (Native)
- German (A2)

Education

Hz university of Applied Science

2023 - 2027

Information and Computation Technology

Coursework

Progressed from Introduction to Programming and Game Dev (**JavaScript**, later **TypeScript**, with **OOP**) through building a web application with **Svelte** and **PHP**/**Laravel** for a real client (Stedin) in an agile workflow, to a **microservices** project in **TypeScript** for a semi formal client (on my GitHub) where I was mainly responsible for the back end and got introduced to **DevOps** and CI. The fourth semester covered **data science**, where I used **Python** to build a machine learning model for a company's "digital twin."

Exchange at Fachhochschule Vorarlberg

Sep 2025 - Dec 2025

For my exchanged I decided to choose the university that offered me the best subjects and although my ideal got cancelled i still took: Augmented Reality, Project Raspberry Pi (**Embedded programming** in **C**), German for internationals, Dev Ops, Mobile App Dev, Computer Graphics and Blockchain Technologies.

Rust Software Developer Internship at AIT (Austrian Institute of Technology)

Feb 2026 - Jun 2026

During this internship I was the main developer of a **black box CRSF protocol fuzzer** in **Rust**, run against a cyber-physical system. Working under the guidance of Dr. Matthias Eckhart, I was involved at every step of the project, from the initial research and brainstorming sessions where we decided how to move forward, to building and maintaining a decently sized codebase from the ground up with a lot of novel features. Along the way I picked up practical pointers on the basics of electrical engineering and gained hands on practice in specific Rust areas such as **multithreaded programming**, **multi target compilation**, and **advanced generic traits.** Being on the offensive side of a security project also taught me how protocols fail under unexpected input, and how a fuzzer can surface weaknesses that would be hard to find by reading code alone.

Projects & Activities

Leetcode

May 2022 – Jul 2023

I believe in the importance of good fundamentals, so before starting university I learned about optimization and problem solving through LeetCode. I managed to solve nearly 500 problems mostly in **C++** and maintained a 13 month solving streak.

MessagerApi

2022 - 2023

I've done a fair bit of web development in my early days, focusing on technologies such as **React** (with **TypeScript**), **Sass**, **REST APIs**, and **Django**. A good example is my MessageAPI project on GitHub.

Rust

After exploring both high and low level languages, I found Rust to offer the control of **C++** with far better structure and safety. I began by studying **The Rust Programming Language** by Steve Klabnik and Carol Nichols, then started building a simple C compiler (currently on hold due to my exchange program). I'm also developing a TUI music player in Rust using **Tokio** for concurrency, which is now almost done.
